COPADO ROBOTIC TESTING (CRT)

PROJECT CREATION & ROBOT CONFIGURATION

A practical, screenshot-led guide based on hands-on CRT trial demonstrations

CRT project workspace after project creation

Prepared by Pranay Dubey

Version 1.0 | October 2026

Document Information

Field	Details
Document title	Copado Robotic Testing (CRT): Project Creation & Robot Configuration
Author	Pranay Dubey
Version	1.0
Scope	Create a CRT project, understand its navigation, and create a Web Testing robot.
Source	User-provided CRT trial screen recordings.
Audience	QA engineers, Salesforce testers, automation testers, and CRT learners.

Accuracy note: This guide documents the workflow and interface visible in the supplied recordings. Labels and options may vary by CRT release, permissions, or trial configuration.

Contents

- 1. Purpose and prerequisites
- 2. Create a new CRT project
- 3. Understand the project workspace
- 4. Understand robot options
- 5. Create a Web Testing robot
- 6. Verification and troubleshooting
- 7. Quick checklist and glossary

1. Purpose and Prerequisites

This guide covers two connected activities: creating a CRT project and creating a Web Testing robot within that project. The steps are based on the two screen recordings supplied for this guide.

Prerequisites

- Access to a CRT organisation or trial environment.
- Permission to create projects and robots in the selected organisation.
- A supported browser and stable internet connection for the cloud-based trial interface shown.

Before you begin: Use a clear project name and follow your team's naming conventions. Do not place passwords, access tokens, or other secrets in project descriptions.

2. Create a New CRT Project

The first recording demonstrates creating a project from the CRT home/workspace screen.

Step 1 — Open the project workspace

Sign in to CRT and open the workspace where projects are managed. If no project exists yet, the workspace may display an empty state and an option to create one.

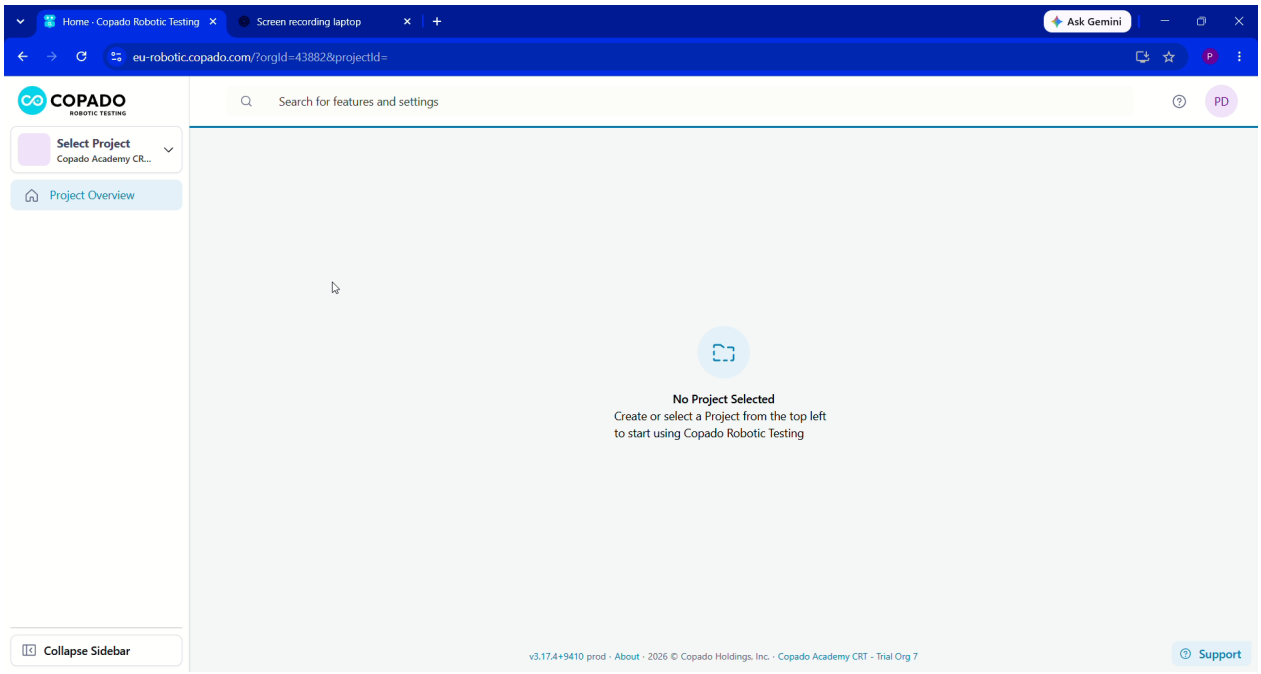

Figure 1. Workspace before a project is created.

Step 2 — Start project creation

Select **New Project**. A project creation dialog opens with fields for the project name and description.

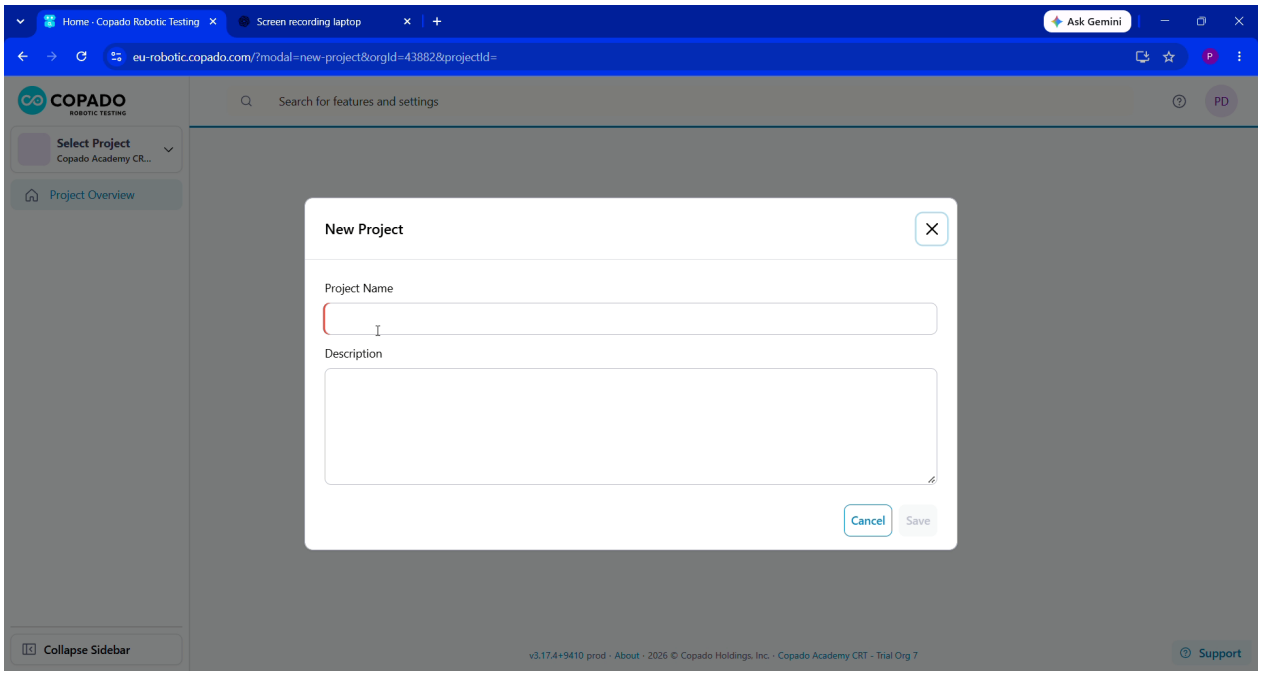

Figure 2. New Project dialog.

Step 3 — Enter project details

Enter a meaningful Project Name. Add a short Description that explains the project's purpose, if useful. Review the values before submitting.

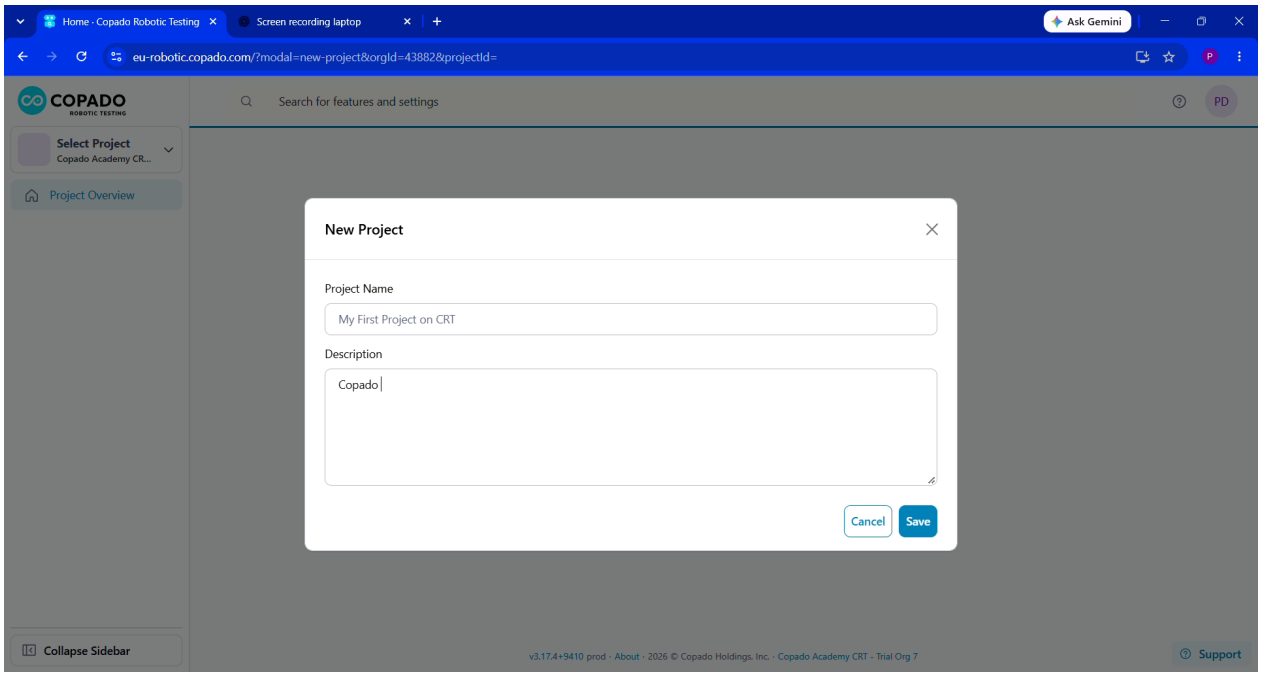

Figure 3. Project details entered in the creation dialog.

Step 4 — Create and confirm the project

Select the create/confirmation action. When creation completes, CRT opens the newly created project workspace or dashboard.

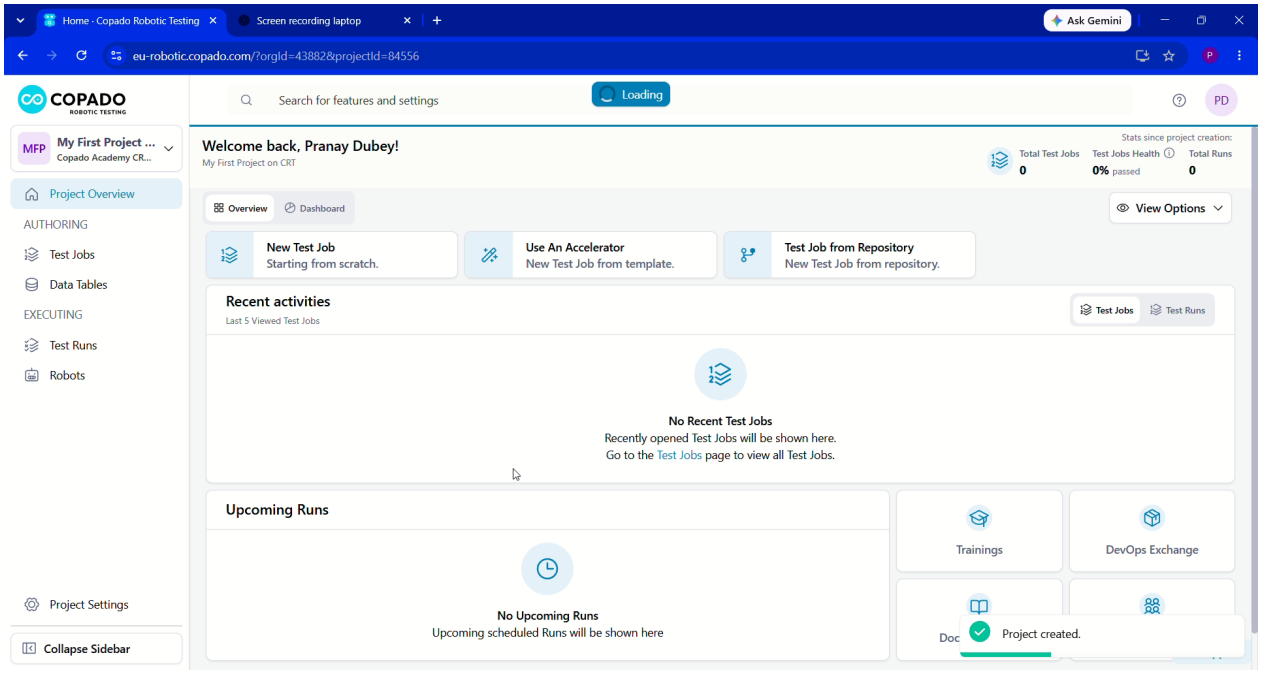

Figure 4. Newly created project workspace.

Expected result: The project is available in CRT and its project-specific navigation is displayed. If creation fails, review validation messages, required fields, and permissions.

3. Understand the Project Workspace

The left navigation groups features for authoring tests and executing them.

Navigation item	Purpose
Project Overview	Starting point for the selected project and summary information.

Navigation item	Purpose
Test Jobs	Create, organise, and manage test jobs.
Data Tables	Maintain structured test data used by automation.
Test Runs	Review test execution runs and their outcomes.
Robots	View, create, and configure robots used to execute test jobs.
Project Settings	Access project-level settings; actions may depend on permissions.

Menu labels and available capabilities may vary with the CRT version and user role.

4. Understand the Robot Options

Open **Robots** to see the robot management page. The recording shows a Default Robot already present. To add another, select **New Robot**.

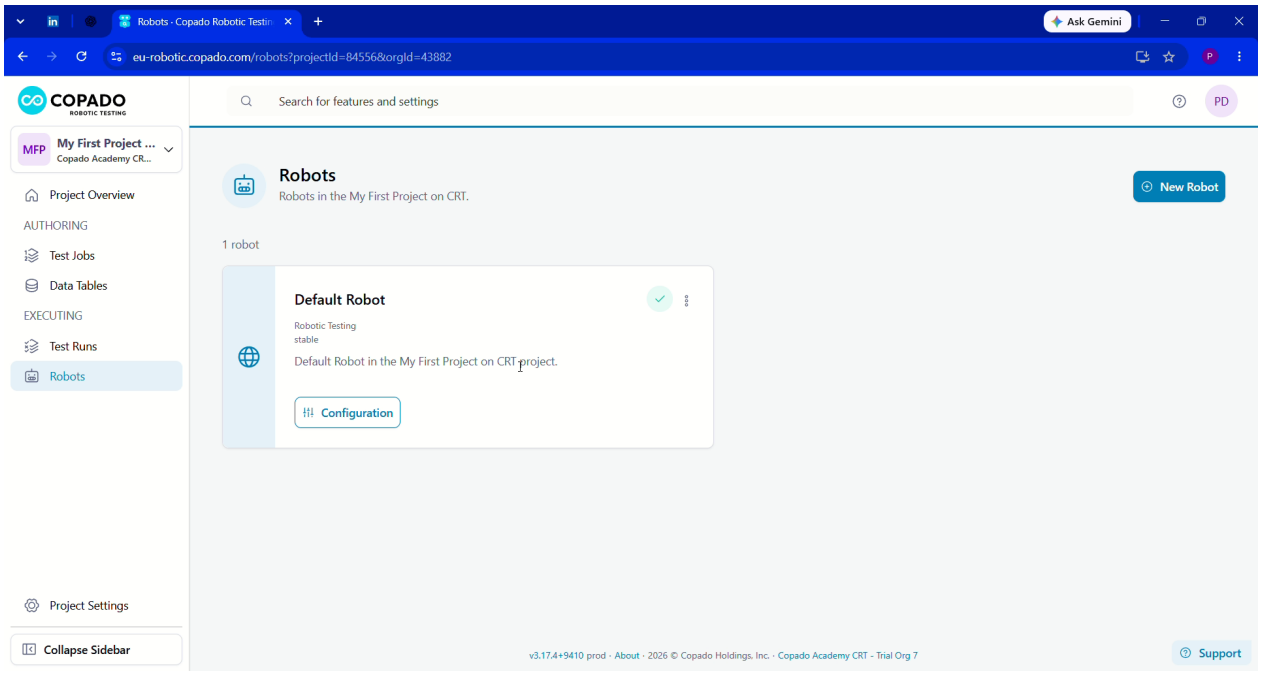

Figure 5. Robots page showing the existing Default Robot.

Option	What the screen shows / guidance
Web Testing	Pre-configured option; the screen says it includes Salesforce testing. Demonstrated in this guide.
Mobile	Visible but disabled in the recorded trial interface.
On-premise	Visible but disabled in the recorded trial interface.
Custom Robot	Available as a separate option; not covered in this walkthrough.

Trial limitation: Mobile and On-premise appeared disabled in the recording. This does not mean they are unavailable in every subscription; confirm entitlements and current product documentation.

5. Create a Web Testing Robot

The second recording demonstrates selecting Web Testing, reviewing the configuration, and creating a robot.

Step 1 — Open Robots and select New Robot

Select Robots from the project navigation. Note the Default Robot, then select New Robot.

Step 2 — Select Web Testing

Choose the Web Testing card. The selection screen identifies it as including Salesforce testing. Continue to the configuration form.

Step 3 — Configure the robot

- **Robot Name (required):** Enter a descriptive name, for example, Web Testing Robot.
- **Robot Description:** Optionally add a short description.
- **Run Environment:** The recording displays Cloud.
- **Robot Type:** The recording displays Robotic Testing.
- **Robot Version:** The recording displays stable, described by the interface as the recommended latest official release. Unstable releases may contain bugs.

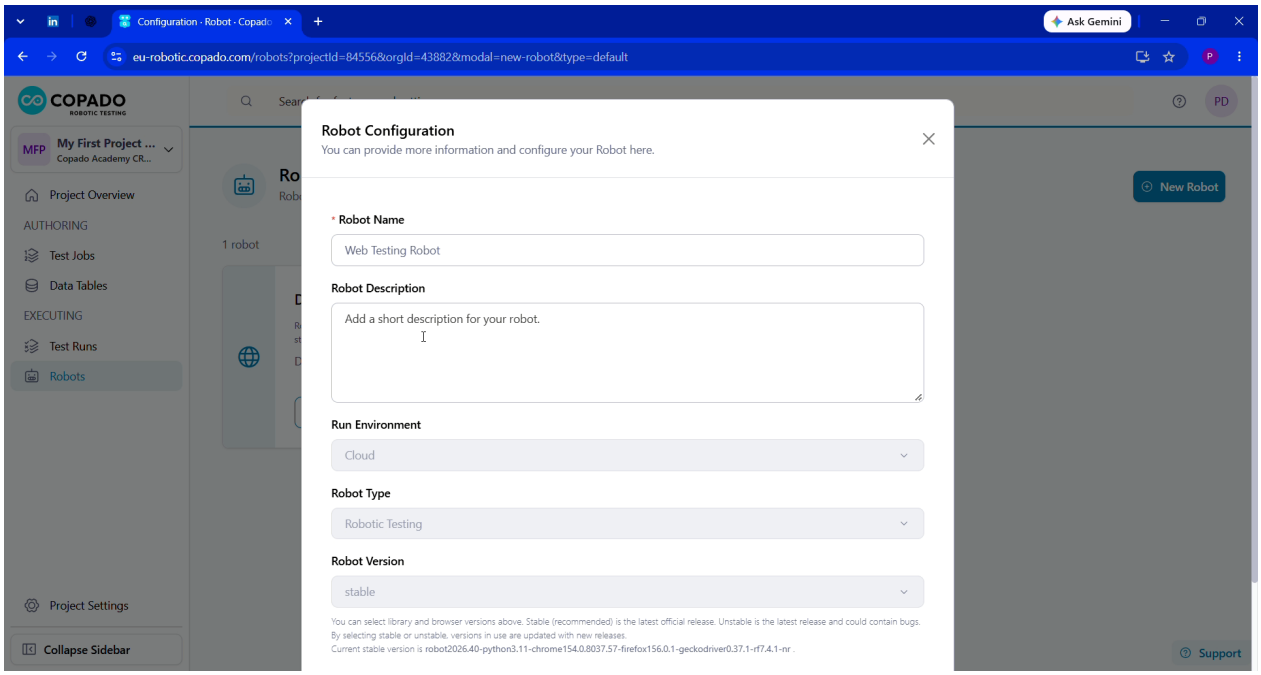

Figure 6. Robot Configuration dialog.

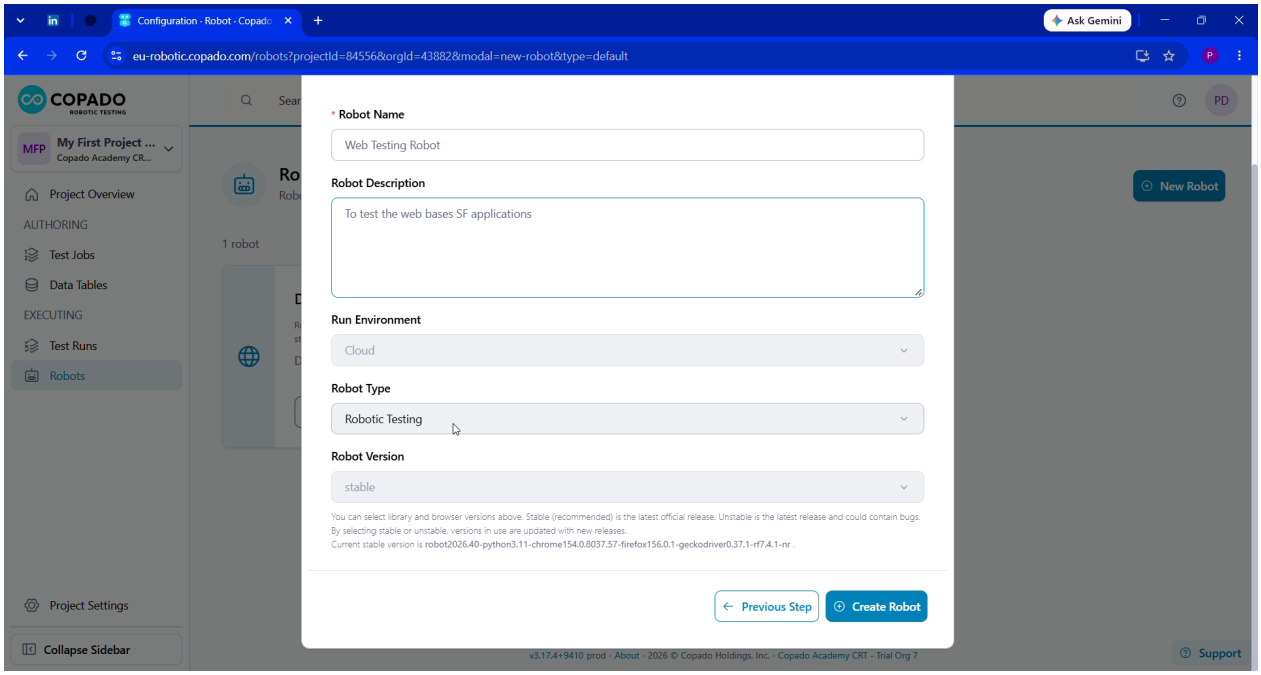

Figure 7. Example robot configuration with name and description entered.

Configuration guidance: The values shown are examples from the recorded environment, not universal requirements. Follow your organisation's standards.

Step 4 — Create the robot

Review the robot name and configuration, then select **Create Robot**. Wait for the operation to complete.

Step 5 — Verify the robot

Confirm that the new robot appears in the Robots page alongside the Default Robot.

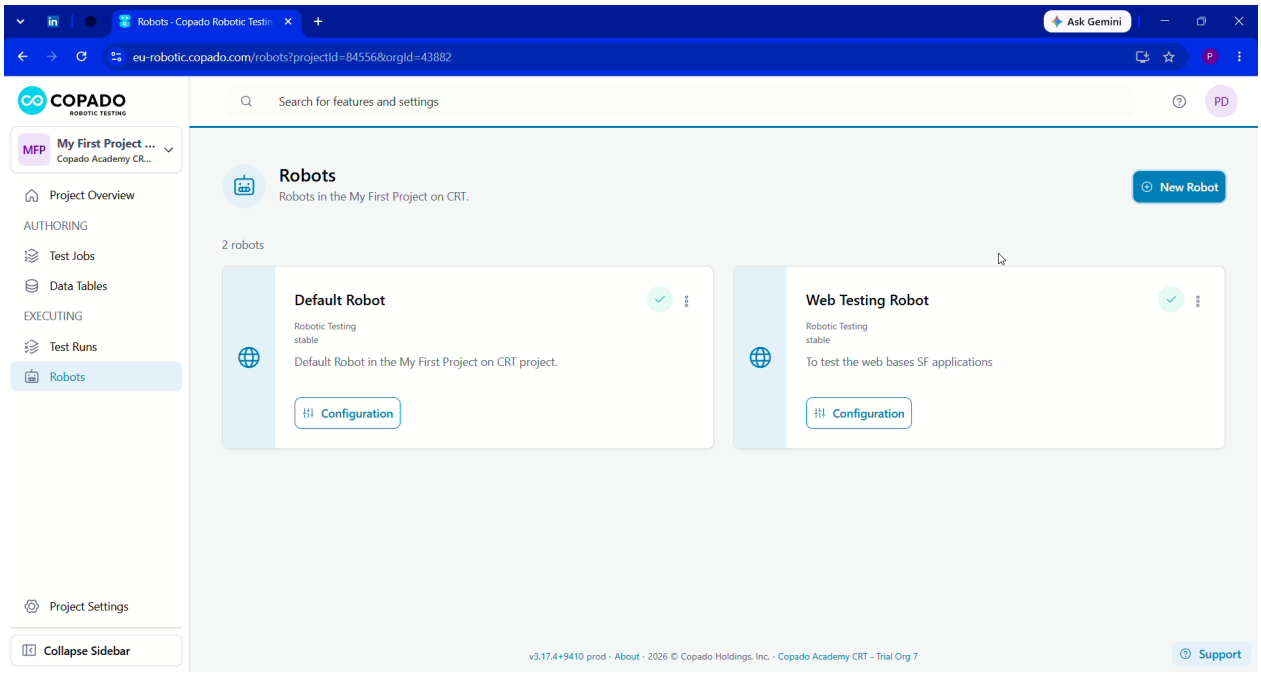

Figure 8. Robots page after the new Web Testing Robot has been created.

Expected result: The robot is listed in the project. Creating a robot does not itself create or execute a test job; those are separate activities.

6. Verification and Troubleshooting

Situation	Suggested check
Project creation does not complete	Check required fields, validation messages, and project-creation permission.
New Robot is not visible	Confirm the correct project is selected, refresh if appropriate, and look for success/error messages.
Mobile or On-premise is disabled	Confirm trial entitlements, role permissions, and current CRT availability.
Unsure which robot version to use	The screen recommends stable. Follow team standards and verify compatibility.
Robot exists but tests have not run	Create or select a test job and follow the separate execution workflow.

7. Quick Checklist and Glossary

- I can access the correct CRT organisation and project workspace.
- I created a project and confirmed its dashboard opens.
- I can identify Project Overview, Test Jobs, Data Tables, Test Runs, Robots, and Project Settings.
- I opened Robots and identified the Default Robot.
- I selected New Robot and chose Web Testing.

- I reviewed the robot name, description, environment, type, and version.
- I created the robot and confirmed it appears in the Robots list.

Term	Meaning
CRT	Copado Robotic Testing.
Test job	An authored automation job/workflow intended for execution.
Robot	The configured execution environment used to run a test job.
Test run	An execution instance of a test job, with results to review.
Stable version	The release channel labelled stable in the recorded configuration screen.

THANK YOU

Keep learning. Keep experimenting. Build confidence through practice.
